1. What does a neuron compute?

1 / 1 point

- A neuron computes the mean of all features before applying the output to an activation function
- \bigcirc A neuron computes an activation function followed by a linear function (z = Wx + b)
- \bullet A neuron computes a linear function (z = Wx + b) followed by an activation function
- A neuron computes a function g that scales the input x linearly (Wx + b)

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

2. Which of these is the "Logistic Loss"?

- $\bigcirc \ \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid^{2}$
- $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1 y^{(i)})\log(1 \hat{y}^{(i)}))$
- $\bigcirc \ \, \mathcal{L}^{(i)}(\hat{y}^{(i)},y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid$
- $\bigcap \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} \hat{y}^{(i)})$

Correct, this is the logistic loss you've seen in lecture!

3. Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?

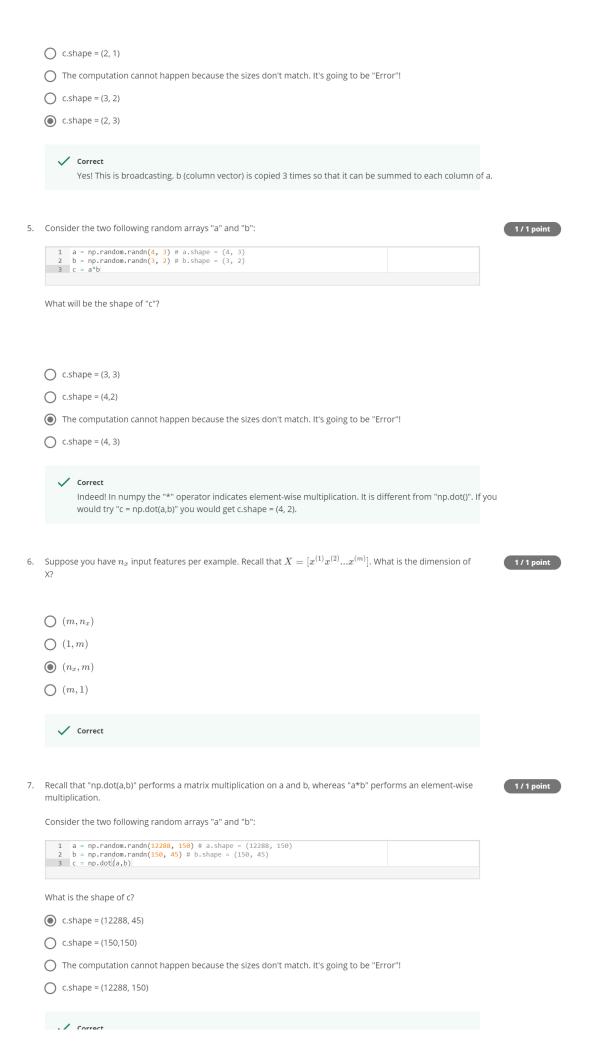

- x = img.reshape((32*32,3))
- x = img.reshape((1,32*32,*3))
- x = img.reshape((32*32*3,1))
- \bigcirc x = img.reshape((3,32*32))

✓ Correct

4. Consider the two following random arrays "a" and "b":

```
a = np.random.randn(2, 3) # a.shape = (2, 3)
b = np.random.randn(2, 1) # b.shape = (2, 1)
3 c = a + b
```

What will be the shape of "c"?

Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because :

"number of columns of a = 150 = number of rows of b"

8. Consider the following code snippet:

How do you vectorize this?

- \bigcirc c = a.T + b.T
- \bigcirc c = a + b.T
- \bigcirc c = a + b
- \bigcirc c = a.T + b

✓ Correct

9. Consider the following code:

1/1 point

```
1 a = np.random.randn(3, 3)
2 b = np.random.randn(3, 1)
3 c = a*b
```

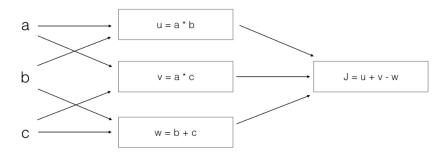

What will be c? (If you're not sure, feel free to run this in python to find out).

- This will invoke broadcasting, so b is copied three times to become (3,3), and * is an element-wise product so c.shape will be (3, 3)
- O This will invoke broadcasting, so b is copied three times to become (3, 3), and * invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "*" to operate on these two matrices. You need to instead use np.dot(a,b)

✓ Correct

10. Consider the following computation graph.

1 / 1 point

What is the output J?

- $\int J = (c 1)*(b + a)$
- J = (a 1) * (b + c)
- $\int J = a*b + b*c + a*c$
- $\int J = (b 1) * (c + a)$

✓ Correct

Yes. J = u + v - w = a*b + a*c - (b + c) = a*(b + c) - (b + c) = (a - 1)*(b + c).
